

CCCA W.I.L.D. RANGERS

JOIN FARMTARIO!

OBJECTIVE: BECOME A FARMER!

Farming takes a LOT of hard work and dedication but let's try your hand at growing some veggies!

There's many vegetables (like celery, green onions, and lettuce) that will re-sprout after leaving them in water for several days.

Using a celery as an example, simply, cut off a tiny portion of the root end and stick the stalk in water. After several days there will be new celery leaves coming out of the middle of the celery (this will happen with lettuce too). For green onions, new onion shoots will come up and new roots will grow. Eventually, all of these can be replanted in some soil.

Root Vegetables (like beets, turnips, and carrots) will re-sprout greens after several months, if you put the root end in some dirt.

Similar to our leafy greens, you want to use as much as possible of the vegetable and use the root end for regrowth.

Stick it in the a couple inches of dirt (do this during the winter) and after several months, you can plant these well-rooted vegetables in the garden.
